

Pragmatic, Lean and Painless Architecture Documentation

SIEMENS MC
Architecture Day 2019
Weisendorf

Peter Hruschka
Atlantic Systems Guild
www.b-agile.de
www.arc42.de
www.req42.de

A collage featuring portraits of authors and book covers. The background is a map of the Atlantic Ocean. The authors and books shown are:

- Steve McMenamin: *Essential Systems Analysis*
- James & Suzanne Robertson: *Mastering the Requirements Process*
- Tom DeMarco: *Peopleware: Productive Projects and Teams*
- Tim Lister: *Barentango*
- Peter Hruschka: *Communicating Software Architectures*

The Atlantic Systems Guild logo is also present at the bottom of the collage.

Do you suffer from ...

... too much source code – and no (up-to-date, trustworthy) documentation?

Do you suffer from ...

... heaps of documentation that nobody reads?

Do you suffer from...

... too many non-related documents, each of them known to only one person (or a small group) and unknown to all others?

Why is he the only one who loves documentation?

Requirements for Architecture Documentation

- **Correct (with respect to source code)**
 - Preferably less, but definitely correct!
 - current
 - ABNC (accurate, **but not necessarily complete**)
- **Maintainable**
 - No redundancy, refrain from too many details
 - Adequate, appropriate: Abstraction instead of completeness
 - compact
- **Understandable**
 - Can only be determined by readers
- **Shall be created in parallel to development**
 - Rarely a priori (exceptions allowed)!

Less is more!

Template-based Documentation & Development

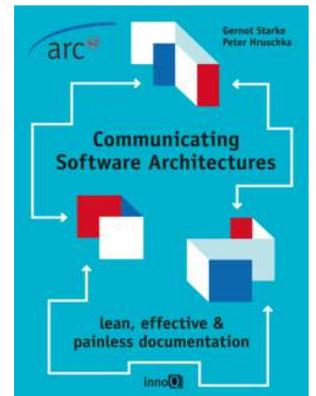

Result driven,
not process driven

arc⁴²

- 1 Intro & Goals
- 2 Constraints
- 3 Context
- 4 Solution Strategy
- 5 Building Block View
- 6 Runtime View
- 7 Deployment View
- 8 Concepts
- 9 Design Decisions
- 10 Quality Scenarios
- 11 Risks/Technical Debts
- 12 Glossary

The ARC42 Template

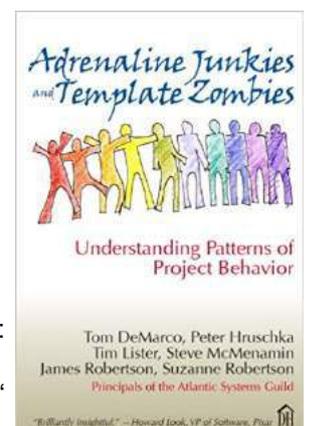

Support for
„Structured Laziness“

Identify your Stakeholders

- 1. Introduction and Goals
 - 1.1 Requirements Overview
 - 1.2 Quality Goals
 - 1.3 Stakeholders
- Architecture Constraints...
 - 2.1

- Ask them what they expect to find in the documentation
- You should never create “orphaned deliverables” *)

*) Anti-Pattern from „Adrenaline Junkies and Template Zombies“:

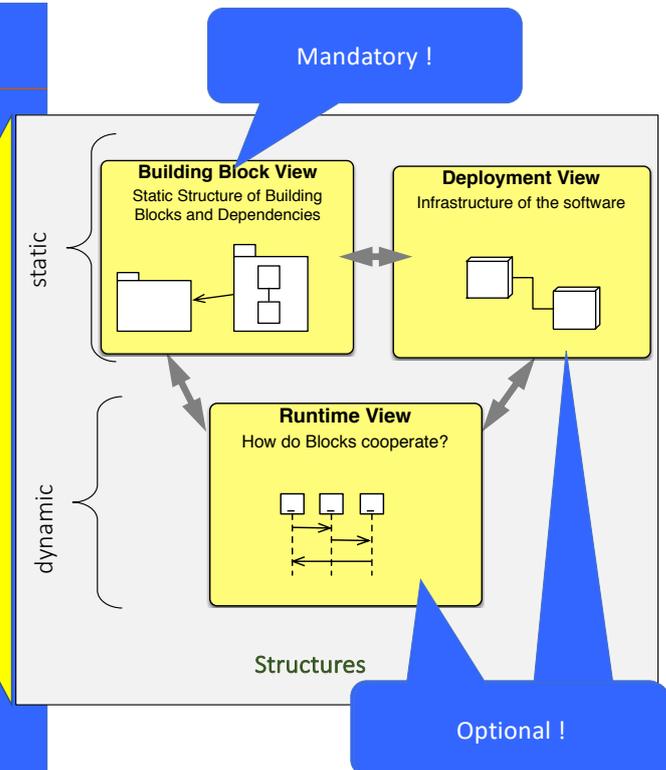

„People develop project artifacts that no one values enough to pay for.“

- 1 Intro & Goals
- 2 Constraints
- 3 Context
- 4 Solution Strategy
- 5 Building Block View
- 6 Runtime View
- 7 Deployment View
- 8 Concepts
- 9 Design Decisions
- 10 Quality Scenarios
- 11 Risks/Technical Debts
- 12 Glossary

3 Views (only)

not 15 (like TOGAF),
not 30 (like the Zachmann Framework)

- 1 Intro & Goals
- 2 Constraints
- 3 Context
- 4 Solution Strategy
- 5 Building Block View
- 6 Runtime View
- 7 Deployment View
- 8 Concepts
- 9 Design Decisions
- 10 Quality Scenarios
- 11 Risks/Technical Debts
- 12 Glossary

Standardize

CONTENT

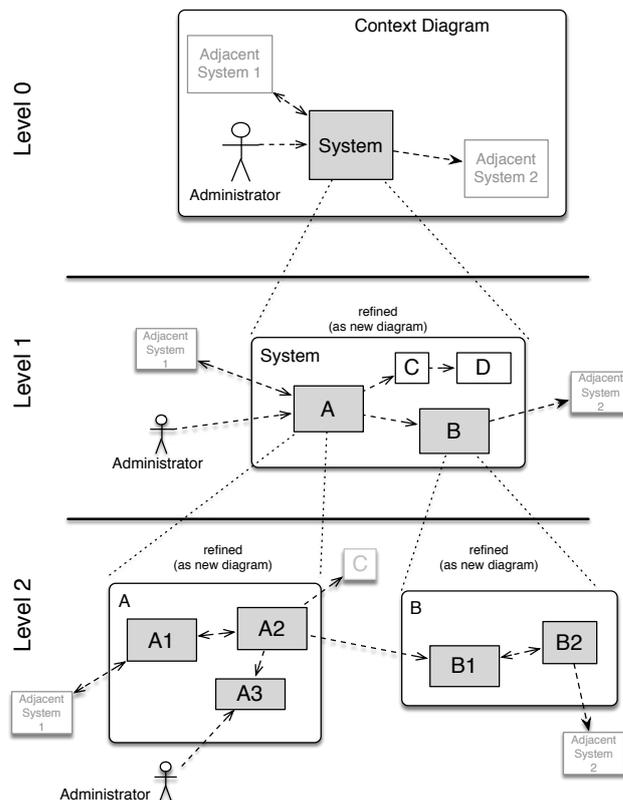

not so much form, notation, tools, *)

...

*) If you can agree, go ahead!
but do it bottom-up, not by management decree

Building Block
View:

A hierarchy of
black and white
boxes

A Game with Numbers

- How many levels?
- How many black boxes?
- How many white box diagrams?

It is not as bad
as you fear

Source Code Level

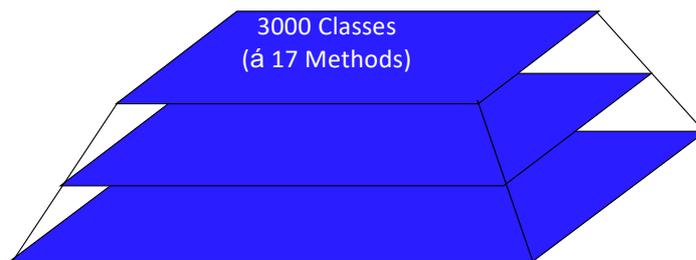

1 000 000 Lines of Code

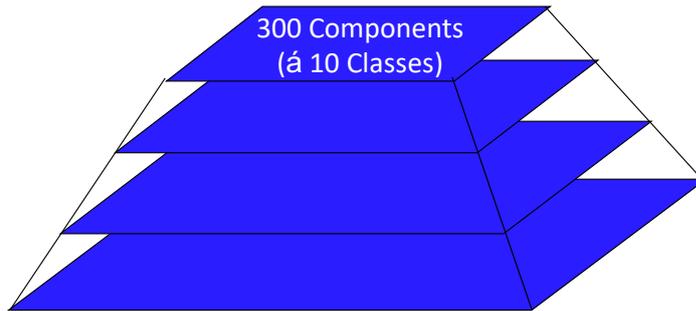

Functions/Methods Level

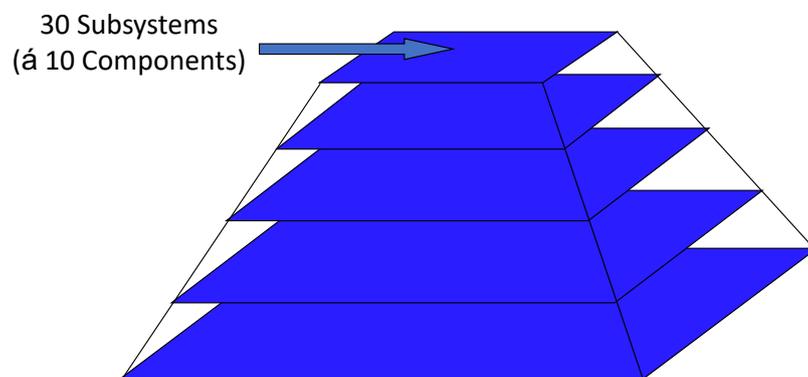

Class Level

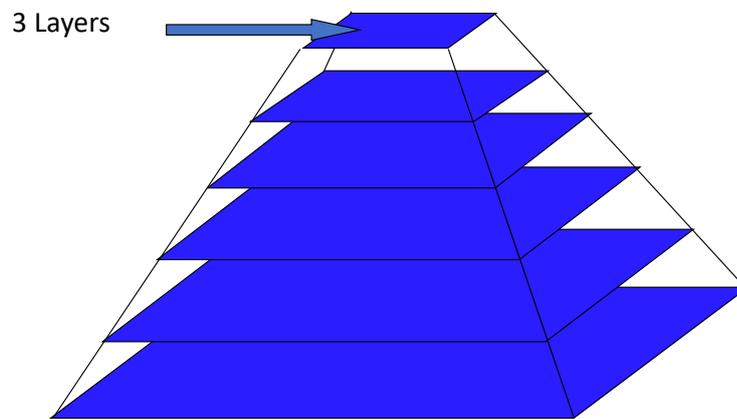

Component Level

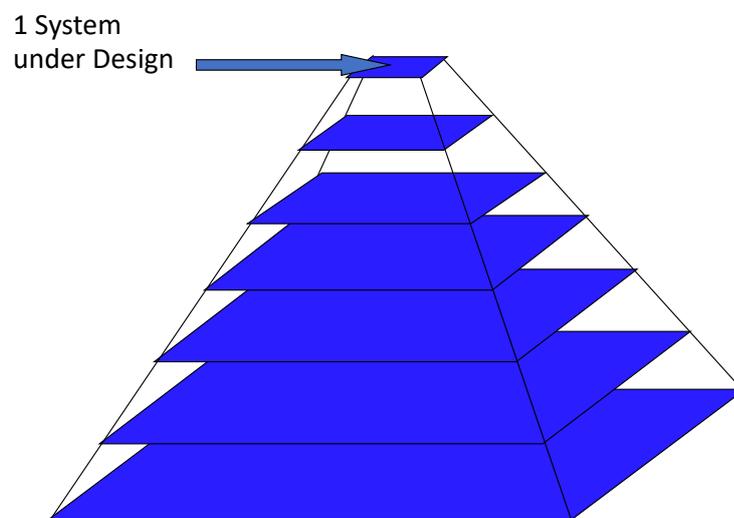

Subsystem Level

System Level

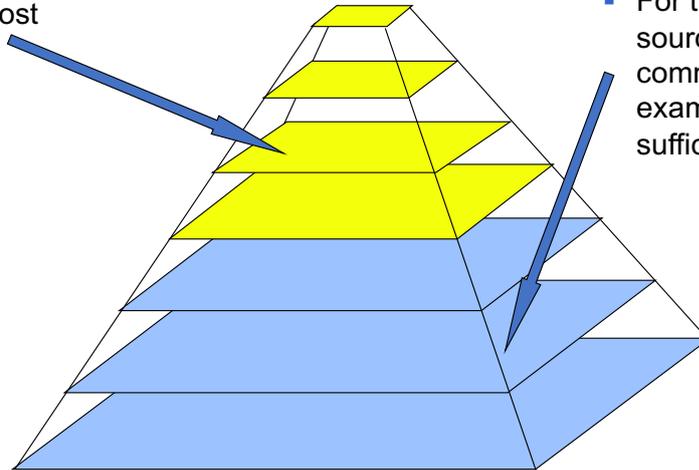

System under Design

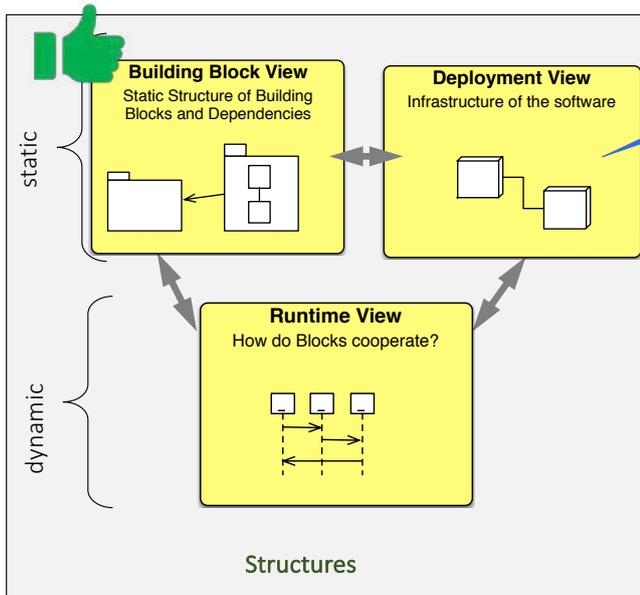

Document your Top-Levels only

- 2 – 3 levels are sufficient for most systems

- For the bottom levels source code with comments and some examples may be sufficient

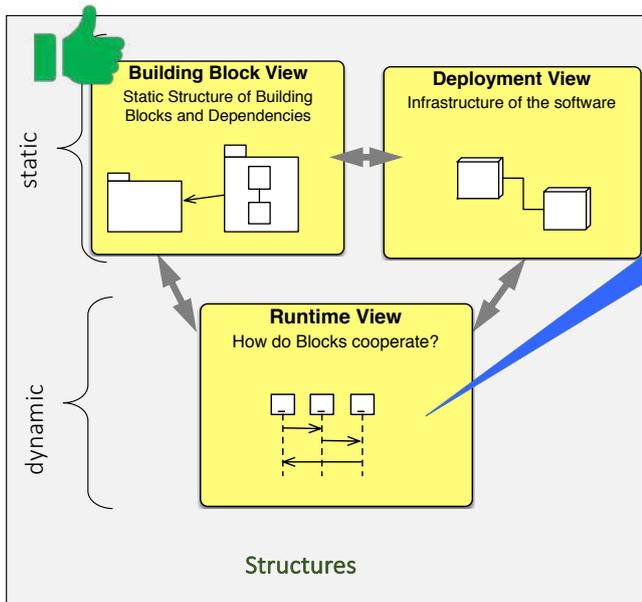

Our goal is NOT to have every line of source code documented in UML

Optional !

Use the deployment view only, if your software is distributed to multiple processors and devices

- Model your infrastructure
- Show the mapping of building blocks to that infrastructure

Optional !

Only document as many scenarios as you can promise to keep up-to-date.

Use scenarios to

1. find missing building blocks
2. add functionality or interfaces to building blocks
3. verify correct cooperation between building blocks

BUT THROW THEM AWAY (OR GIVE THEM TO THE TESTERS TO MAINTAIN) RATHER THAN LET THEM GET OUTDATED

arc⁴²

- 1 Intro & Goals
- 2 Constraints
- 3 Context
- 4 Solution Strategy
- 5 Building Block View
- 6 Runtime View
- 7 Deployment View
- 8 Concepts
- 9 Design Decisions
- 10 Quality Scenarios
- 11 Risks/Technical Debts
- 12 Glossary

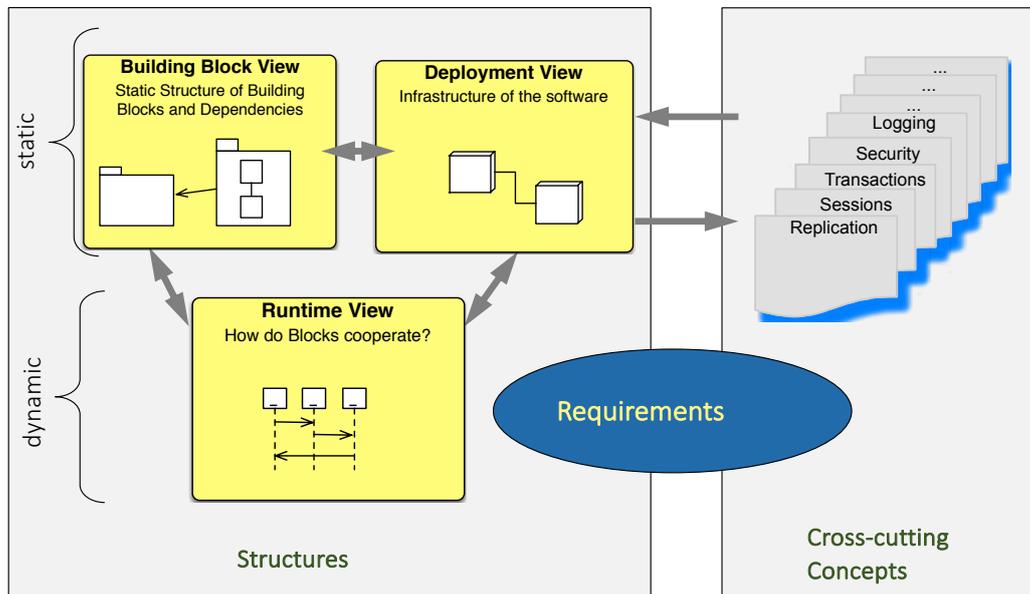

The ARC42 Template

**VIEWS
&**

**CROSS-CUTTING
CONCEPTS**

Documenting Architecture... ... with different views

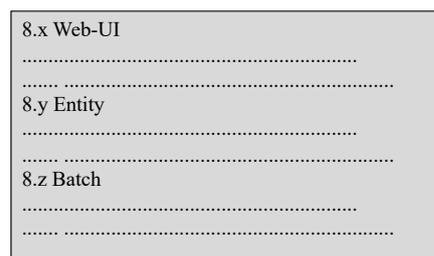

... and crosscutting concepts

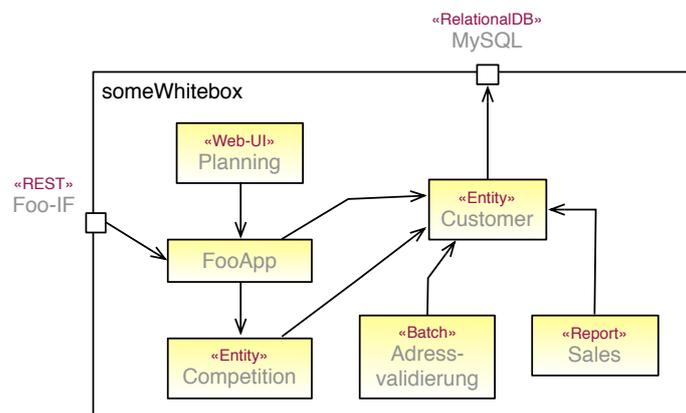

Use concepts instead of repeated documentation...

1. Explain cross-cutting concepts once in chapter 8

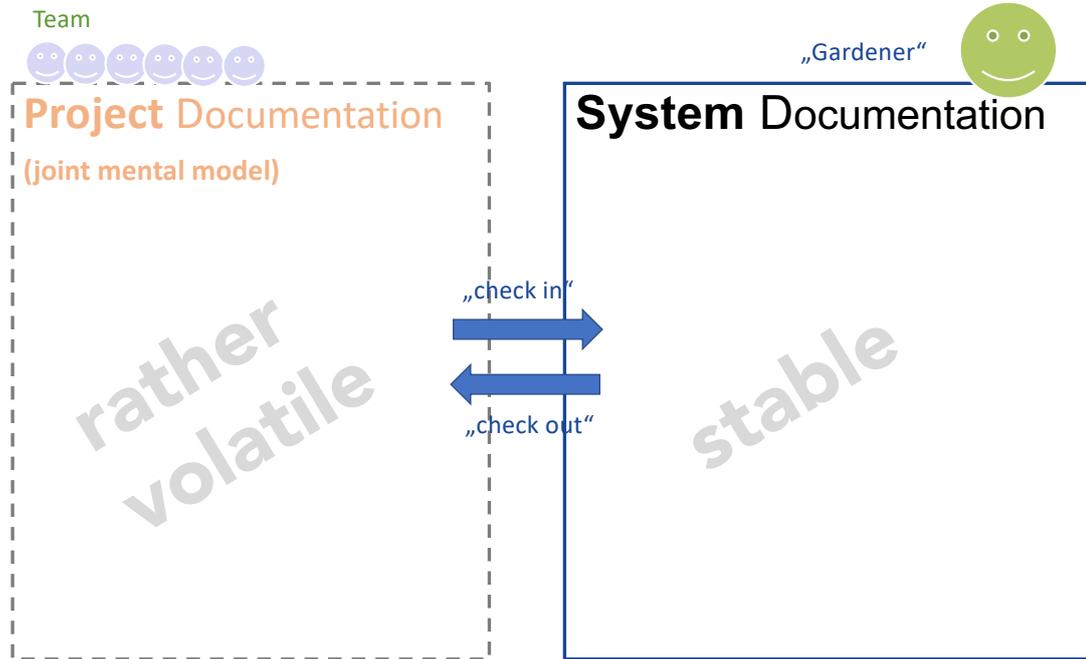

- with concrete technology stacks
- with examples
- with rules for implementation

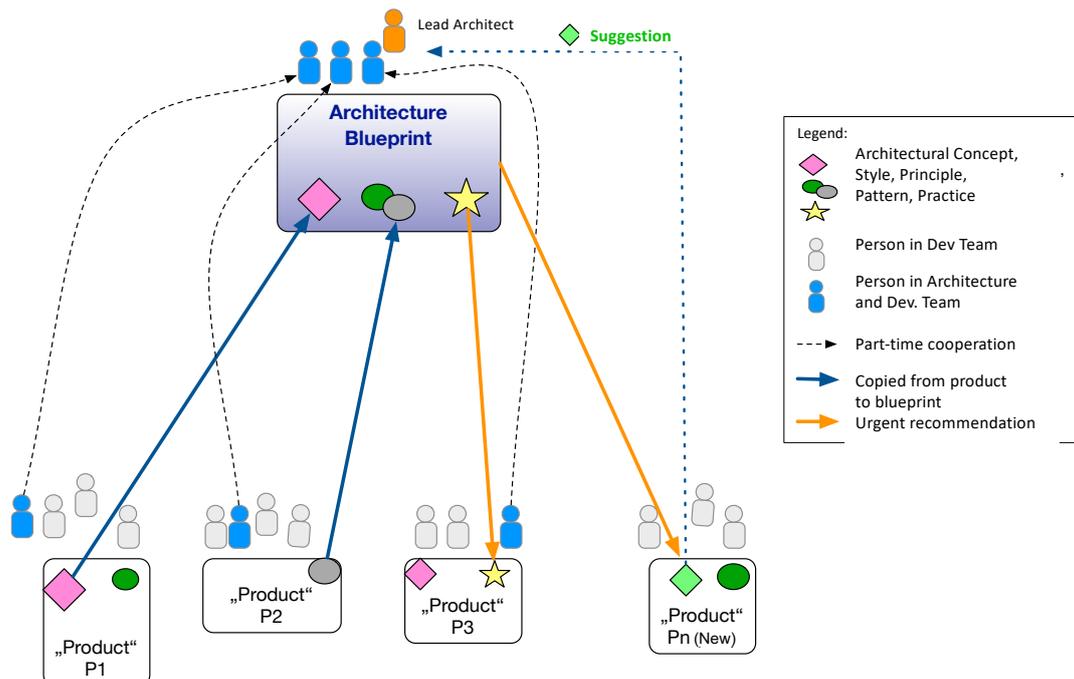

2. Link concepts to building blocks e.g. via stereotypes

Manage Documentation like Source Code

Architecture in larger Teams

Be
pragmatic:
Less is more

Enough documentation to quickly understand the architecture of your system instead of source code reengineering

Ask stakeholders what they will be looking for instead of guessing what to write

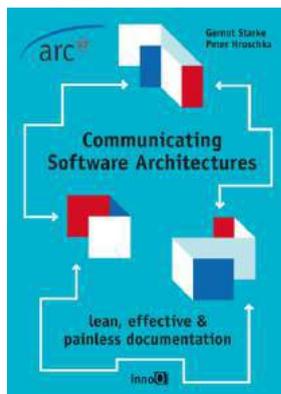

Document the overview, not the details

Concentrate on communication, not completeness

Extract cross-cutting concepts instead of redundantly documenting them in multiple parts of your documentation

Outdated documentation is worse than no documentation: keep it simple!
